Mathematical Analysis I   VERSION A   July, 1 2010

Surname, Name, Matriculation number:

Degree Course: Surname of Professor:

Warning: *The written exam is composed of 3 exercises. The solutions (computations, explanations and conclusions) must be written in detail on separate sheets of paper, that must be handed in at the end, with the candidate's name written on top. The present question sheet must be also returned.*

Exercise 1. (12 marks) Consider the function

$$f(x) = e^x(2x^2 - 3|x|) \ .$$

a) Find the domain, the zeroes and the sign of the function.

b) Compute the limits as x tends to the extreme points of the domain. Find all possible asymptotes of f, if they exist.

c) Find all possible points where f is not differentiable, if they exist. Compute the derivative function f', where it exists.

d) Find the monotonicity intervals and possible maximum and minimum points of f.

e) Draw a qualitative graph of f.

Exercise 2. *(9 marks)* Let $\alpha \in \mathbf{R}$, and consider the function

$$f(x) = \frac{x^2 + \alpha x + 2}{1 + 2x}.$$

a) Compute the MacLaurin expansion of order 3 of f.

b) Determine $\alpha \in \mathbf{R}$ such that $f^{(3)}(0) = 2$.

Exercise 3. *(9 marks)* Solve the differential equation:

$$y'' + 4y = \cos 2x.$$

Mathematical Analysis I   VERSION B   July, 1 2010

Surname, Name, Matriculation number:

Degree Course: Surname of Professor:

Warning: *The written exam is composed of 3 exercises. The solutions (computations, expla-nations and conclusions) must be written in detail on separate sheets of paper, that must be handed in at the end, with the candidate's name written on top. The present question sheet must be also returned.*

Exercise 1. (12 marks) Consider the function

$$f(x) = e^{-x}(2x^2 - 3|x|) \ .$$

a) Find the domain, the zeroes and the sign of the function.

b) Compute the limits as x tends to the extreme points of the domain. Find all possible asymptotes of f, if they exist.

c) Find all possible points where f is not differentiable, if they exist. Compute the derivative function f', where it exists.

d) Find the monotonicity intervals and possible maximum and minimum points of f.

e) Draw a qualitative graph of f.

Exercise 2. *(9 marks)* Let $\alpha \in \mathbf{R}$, and consider the function

$$f(x) = \frac{x^2 + \alpha x + 3}{1 + 2x},$$

a) Compute the MacLaurin expansion of order 3 of f.

b) Determine $\alpha \in \mathbf{R}$ such that $f^{(3)}(0) = 1$.

Exercise 3. *(9 marks)* Solve the differential equation:

$$y'' + 9y = \sin 3x.$$
